#### unix commands

#### directory commands

1s -al list contents of a directory showing long details and including all

files (including hidden dot files)

cd ~ change directory to home directory cd .. change directory up one level

cd dirNm change directory to the directory named dirNm which must be in

the current dir

mkdir dirNm make a new directory in the current dir and call it dirNm rm -r dirNm recursively removes the specified directory and its contents print working directory shows the full path for the current

directory

du | sort -n disk usage of each directory and subdirectory sorted by size

## copying, removing, renaming files

cp fileFrom fileTo
rm fileNm
removes the file fileNm
mv fileFrom fileTo
moves (renames) the file

### viewing, editing text files

cat fileNm view file, but it scrolls quickly

more *fileNm* view file one page at a time. Use **q** to quit. less *fileNm* view file like more, but with extra features

vi fileNm edit file using the vi editor

cat >fileNm creates a file named fileNm using input from the terminal.

Multiple lines with ENTER are ok. It writes it out when you press

CTRL-D.

## showing and killing processes

CTRL-C Cancel current executable

ps -f -u userName lists processes for the specified user

kill -9 processId kills the specified processId

### changing access permissions

chmod u+rw *fileNm* changes the specified file(s) to give you read (r) and write (w) chmod a+rx *fileNm* changes the specified file(s) to give all users read and execute chmod a-rw *fileNm* changes the specified file(s) to remove read and write from all

users.

chmod o+r *fileNm* changes the specified file(s) to give other users read.

#### file redirection and pipes

command >fileNm redirects the output of command to the specified file.

e.g., Is >Is.out will place the output of Is into Is.out

command <fileNm redirects the input to command from the specified file.

e.g., sort <stuff.txt would sort the contents of file stuff.txt

command1 | command2 | pipes the output of command1 into the input for command2.

e.g., ls -al | more will pipe the output of ls -al into more

command >>fileNm appends the output of the command onto the existing file

command <file1 > file2 redirects input to be from file1 and output to be to file2

# file name patterns

Many commands support the use of file name patterns for determining their arguments. This can speed up doing things.

rm \*.o would remove all files with a name that ends with .o. Be

careful!!! rm \* .o would remove all files since there is a space

before the .o

mv \*.c dirNm moves all the .c files from the current directory to the specified

directory

1s -1 cs1713p[1-5]\*.c would list the files that begin with cs1713p, followed by any of

the characters 1 through 5, followed by any character, and then

ended with a .c

1s -al ../\*.c would list all the files which are one directory up and end in .c

#### miscellaneous commands

man command This will show a manual page for the specified command. Use **q** to quit.

gcc -g -o execFileNm fileNm.c

compiles *fileNm*.c with debugger information, producing *execFileNm* 

passwd change your password

echo \$variable show the value of the shell/environment variable

**command** & invokes the specified command (you can also include its parameters) as

a background process

wget URLFileAddress web get will get a file on the web at the specified address

wget cs.utsa.edu/~clark/cs1713/p2Input.txt
The retrieved file might have \r\n from windows.

od -c <fileNm Shows \r\n when the file contains them.

sed -i 's/\r//'  $\it fileNm$  Removes carriage returns from the file.

# shell typing features

↑↓ While typing commands in the Unix shell, use the up arrow and down

arrow to scroll through the previously entered command lines

TAB While typing commands in the Unix shell, use the tab key to prefill

filenames. You can type part of a filename and press tab, showing

filenames that match.
